Section 1 : Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 20 30 40 50
Output: 10 20 30 40 50

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int id;
    struct Node* next;
    struct Node* prev;
} Node;
typedef struct DoublyLinkedList {
    Node* head;
    Node* tail;
} DoublyLinkedList;
Node* createNode(int id) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->id = id;
    newNode->next = NULL;
    newNode->prev = NULL;
    return newNode;
}
DoublyLinkedList* createList() {
    DoublyLinkedList* list = (DoublyLinkedList*)malloc(sizeof(DoublyLinkedList));
    list->head = NULL;
    list->tail = NULL;
```

```
    return list;
}
void append(DoublyLinkedList* list, int id) {
    Node* newNode = createNode(id);
    if (list->head == NULL) {
        list->head = newNode;
        list->tail = newNode;
    } else {
        list->tail->next = newNode;
        newNode->prev = list->tail;
        list->tail = newNode;
    }
}
void displayList(DoublyLinkedList* list) {
    Node* current = list->head;
    while (current != NULL) {
        printf("%d ", current->id);
        current = current->next;
    }
    printf("\n");
}
int main() {
    int N;
    scanf("%d", &N);
    DoublyLinkedList* list = createList();
    for (int i = 0; i < N; i++) {
        int id;
        scanf("%d", &id);
        append(list, id);
    }
    displayList(list);
    return 0;
}
```

Status : Correct **Marks : 10/10**
